CHAGEE

CHAGEE SINGAPORE

FORECAST THE PEAK, SHARE THE COUNTER

PREDICTIVE AI AND ROBOTS AT THE COUNTER: WHAT THE GM DECIDES FOR THE BUSIEST HOUR

OPIM639 · GROUP 3 · KEZIAH, JIN, AYUMI, REVAN · OCTOBER 2026

SPEAKER NOTES · TITLE

Good morning. We are Group 3. Our company is Chagee, and we look at one place in its business: the counter of a Singapore outlet in its busiest hour.

Two kinds of AI meet there. Predictive AI forecasts how busy the hour will be. Robotics, Chagee's tea machines, brew the fixed steps. Around them, people share the hand steps like a bucket brigade.

Our decision-maker throughout is the GM, Chagee Singapore's general manager. Timing: title and agenda together, about twenty seconds.

Agenda

01 **Chagee in Singapore**
How it earns and sells

02 **From farm to cup**
Where the supply chain is stable, and where it is not

03 **The data trail**
What every cup already records

04 **Our scope**
One area, one decision-maker

05 **Predict demand**
App searches, DBSCAN and a new-store pin

06 **Share the counter**
The bucket brigade, side by side

07 **Split the counter**
Which steps stay human: the GM's call

08 **The GM's playbook**
Triggers, pilot and limits

SPEAKER NOTES · AGENDA

Eight short chapters. The first four set the scope; the last four are the forecast, the counter, the GM's split and the playbook. Click any chapter to jump there.

In Singapore, Chagee runs its own outlets, and every channel ends at one counter

The same team owns the counter, the app data and the call on who works the peak.

HOW A SINGAPORE CUP IS SOLD · STEP THROUGH

GROUP NET REVENUE, FY 2025 (SECONDARY SOURCE)

Franchise **88%** Company-owned **12%**, growing fastest

Singapore is company-owned: run by Chagee corporate, as is usual for new-entry markets SG

In store	walk-in, counter or kiosk
Chagee app	order ahead, collect or delivery
Grab	third-party delivery

One counter
every channel's cup is made here

44 outlets, ground-floor mall units by policy; kiosks in basements and MRT stations at entry in 2019

- **Company-run**
  Outlets are run by Chagee itself, so the GM can roll out a new counter design and roster rule centrally.
  Team check, to confirm with Chagee
- **App-first**
  Most orders come through the app, with few kiosks in store. Every order and search is logged: the raw material for a forecast.
  Team observation, to confirm
- **Why Chagee**
  A fast-growing, playful brand with heavy app use: plenty of data, and room for AI to help the stores.

TAKEAWAY | Whatever the channel, every order ends at one counter. The peak hour is where an outlet wins or loses.

SPEAKER NOTES · CHAGEE IN SINGAPORE

Step through four points. One: at group level most revenue comes from franchising, about 88% in FY 2025; company-owned is about 12% and growing fastest. That split is from a secondary source.

Two: Singapore is company-owned, run by Chagee corporate. We have this from a team check; we will confirm it with Chagee.

Three: 44 outlets, by the store directory in October. Chagee prefers ground-floor mall units.

Four: walk-in, app and Grab all end at the same counter. That is why we look at the counter. About fifty seconds.

Supply is standard and planned ahead; the counter feels demand within minutes

Tea leaves travel one standard route. Only fresh milk and fruit are bought locally.

FOLLOW ONE CUP · STEP THROUGH

Source

Tea leaves from Yunnan through standard channels for every market

DATA CREATED

Shipments, lead times

Local: fresh milk, fruit

Warehouse

Separate central and regional warehouses keep storage and logistics costs down

DATA CREATED

Stock vs par, expiry

Outlet counter

Machines brew each cup from a scanned recipe; people do ice, toppings and hand-over

DATA CREATED

Cups by hour

Wait times

Last mile

Self-collect, Chagee app delivery or Grab; riders wait at the same counter

DATA CREATED

Orders by channel

Rider wait

Customer

Orders in the app, collects at the counter, comes back (or not)

DATA CREATED

App orders, drop-offs

- **Stable upstream**

  Standard sourcing, regional warehouses and forecast-led restocking: Chagee already plans this part.

  YF Chuhai; Chagee Form 20-F

- **Volatile downstream**

  Demand at a counter moves by the hour: lunch, a mall event, rain, a new drink launch.

- **So we stop at the counter**

  The open question is not the shipment. It is how many people the counter needs this hour, and how they work.

TAKEAWAY | Chagee already plans its stock. The open problem is matching people to the hourly peak.

SPEAKER NOTES · FROM FARM TO CUP

Press play and the cup travels farm to customer. Sourcing is standard; only fresh milk and fruit are local (YF Chuhai). Chagee runs central and regional warehouses (Form 20-F) and already plans restocking from forecasts.

The volatile part is the counter, the red chips. Under time pressure, summarise this slide in one sentence: supply is planned, the counter is not. About forty seconds.

Every cup is already a timestamped record: the inputs for a forecast exist today

Four data sources and six decisions they could feed. We follow the four that start in the app and end at the counter.

WHICH SOURCE FEEDS WHICH DECISION · STEP THROUGH

	Store and production	App and members	Delivery	Supply and context
Demand forecasts	Cups per hour by drink and channel	Member repeat demand	Orders per hour by platform	Weather, holidays, launches
Staffing and prep	Wait times, machine logs	Pickup no-shows	Hand-over peaks	Labour hours vs cups per hour
Replenishment	Drink mix per outlet	Launch trial rates	Group-order toppings	Ingredient use, expiry, par
Queue and capacity	Wait time, footfall vs sales	Store-select drop-offs	Rider wait at counter	Stock-outs at peak
Site selection	Sales density per outlet	"No store nearby", home and work	Distance and fee by postcode	Mall footfall, competitors
Menu and promos	Drink share, customisation	Trial and repeat, voucher uplift	Delivery basket mix	Collab calendar

White chips mark the core input; grey text refines it. Red rows: our scope.

- **No new sensors needed**
  Point-of-sale, app and machine logs already exist. The work is joining them by outlet and hour.
- **The app is the link**
  Only the app ties a cup to a person. That needs consent and care under Singapore's data protection law (PDPA).
- **What we take forward**
  Demand forecast, then staffing, then queue capacity: one chain that ends with the GM's counter and roster.

TAKEAWAY | The data for an hourly forecast is already collected. What is missing is turning it into a roster.

SPEAKER NOTES · THE DATA TRAIL

Each step lights up one decision and the data that feeds it. Skip to the last step under time pressure: our scope is the three counter rows: forecast, staffing, queue.

This list is our reading of what Chagee's systems record, based on public material and our industry conversation, not a Chagee data dictionary. About fifty seconds.

One area, the in-store peak, and one decision-maker: the GM

Ideation gave us three improvement areas. The counter is where AI and the course's operations tools meet.

FROM THREE IDEAS TO ONE · STEP THROUGH

FUTURE WORK

Online retailing

Steer orders between app pickup and Grab by hour.

Needs platform fees and price tests we do not have.

FORECAST ONLY

New stores

Forecast a new outlet from app searches (slide 05).

Rent, fit-out and payback stay future work.

OUR FOCUS

In-store operations

Forecast the peak, set the roster, share the counter.

Data exists, the decision is daily; Topic 3 forecasting, Topic 6 bucket brigades.

AI · PREDICTIVE

Forecast cups per hour from history, calendar and app orders.

AI · ROBOTICS

Tea machines brew the fixed steps from a scanned recipe.

OPERATIONS TOOLS, NOT AI

Bucket brigade and cross-training: how people share the hand steps.

The GM

General manager, Chagee Singapore

DECIDES	Which counter steps go to robots, how many people work the peak, and how they share it
WHEN	Before a store opens, and when rosters are set
USES	The forecast and the counter simulation
TODAY	To confirm with Chagee: how rosters are set now

TAKEAWAY | Predictive AI says how many people the peak needs; the GM decides which steps robots do; the bucket brigade decides who does what.

SPEAKER NOTES · OUR SCOPE

Our ideation produced three areas. We park online retailing as future work, forecast new stores from app data, and focus on the in-store peak.

We are careful about what counts as AI: the forecast and the machines. Bucket brigade and cross-training are operations tools, but they decide whether a lean roster actually works.

The decision-maker is the GM; outlet teams run the roster day to day. We do not yet know how Chagee sets rosters today; that is a question for our industry contact. About fifty seconds.

App searches show where demand goes unserved: cluster them, drop a pin, forecast the store

Chagee Singapore sells mainly through its app, so every search is a demand signal, even where no store is near.

APP DEMAND TO A NEW-STORE FORECAST

SUGGESTED PIN 1, NEAR CHOA CHU KANG

1,326 cups a day forecast

New to Chagee (no store nearby today)	**831**
Taken from existing outlets	**495**
· outlet 3.1 km away	**−207**
· outlet 4.2 km away	**−109**
Against the average outlet	**2.4×**

Peak hour 13:00: **146 cups** → **2 people** on today's counter (slides 06–07).

Synthetic app data on the team's map; outlet positions approximate (the central inset is enlarged). Not a trained model: the point is the method.

TAKEAWAY | The top cluster, near Choa Chu Kang, would sell about 1,326 cups a day, 831 of them new to Chagee. A pin beside an existing outlet mostly moves cups around: about 84% of its sales are taken from that outlet.

SPEAKER NOTES · PREDICT DEMAND FOR A NEW STORE

Chagee Singapore runs on its app, with few kiosks, so every search is a demand signal, including searches where no store is close. That makes the app the forecasting input for a new store, before it has any sales.

Step one: synthetic app sessions on our map. Gold are within walking distance of an outlet; red found no store nearby. Step two: DBSCAN, unsupervised machine learning, groups red searches that are dense; scattered ones are noise. Step three: cluster centres are candidate sites.

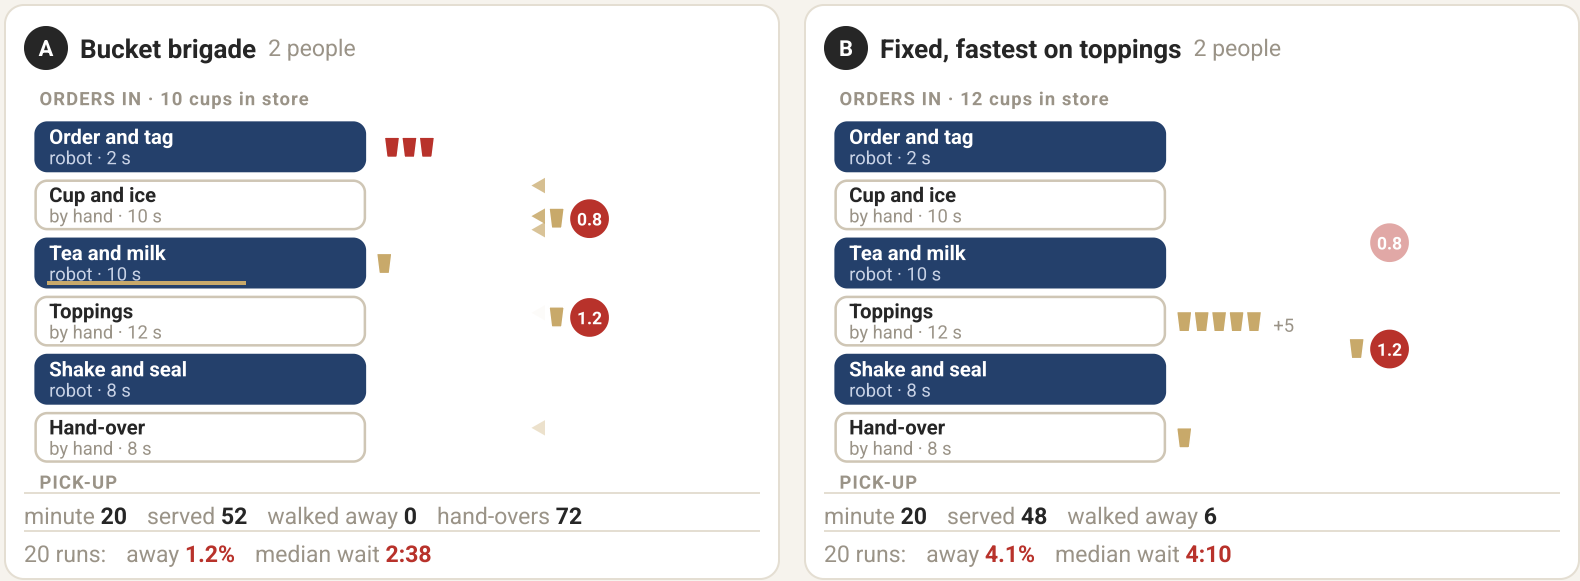

Step four: click the map to drop a pin. The model splits nearby searches between stores by distance, so a pin next to an existing outlet mostly takes its customers. Step five: the forecast's peak hour gives the opening roster for the counter on the next slides.

The three sliders are the only inputs: cluster radius, minimum searches per cluster, and how far people will walk. The data is synthetic; with Chagee's real app logs, the same steps would run unchanged. About one and a half minutes.

With a lean roster, a bucket brigade keeps cups moving without knowing who is fastest

Today's counter, two ways of sharing the hand steps, side by side. Pick what each side runs.

PEAK HOUR · SAME CUSTOMERS ON BOTH SIDES

Red circle = a person (number = speed) · gold ring = held back · faded = walking · ▲ = hand-over · navy = robot · red cup = waiting for a person

ALL THREE RULES, MEAN OF 20 RUNS

EVENT DAY, 2 PEOPLE	WALKED AWAY	MEDIAN WAIT
Bucket brigade	**1.2%**	**2:38**
Fixed, fastest on toppings	4.1%	4:10
Fixed, slowest on toppings	34.9%	9:47

At the people on side A. A customer leaves if the wait would pass 5 min. With spare people, a well-assigned fixed line is as good or a little faster.

Why lean is where it counts

Work flows to whoever is free, so the line balances itself (Topic 6). Fixed stations are only as good as the guess of who is fast.

TAKEAWAY | At the forecast's roster on an event day, the brigade loses about 1.2% of orders; fixed stations lose 4.1% to 35%, depending on who is on toppings.

SPEAKER NOTES · SHARE THE COUNTER

Same counter, same customers, two sharing rules side by side. Robots, the navy boxes, take the order, brew tea and milk, and shake and seal. People do cup and ice, toppings and hand-over.

Left, a bucket brigade: each person carries a cup forward; the last hands it over, walks back and takes over a colleague's cup. Right, fixed stations: each person owns a station.

Press play on an event day. Then set the right side to "slowest on toppings": the queue builds at toppings and customers walk away. The brigade never needed to know who was fast.

Be honest about the other case: add people and fixed stations catch up, or are a little faster. About one minute.

Which steps stay human? Robots buy a shorter wait; on a normal day, people are still cheaper

Choose a split for each side, or click any station to hand it to a robot or a person, then run the peak hour.

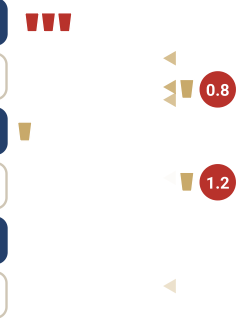

PEAK HOUR · SAME CUSTOMERS ON BOTH SIDES

A **Today's counter** 2 people, brigade

ORDERS IN · 10 cups in store

- Order and tag — robot · 2 s
- Cup and ice — by hand · 10 s
- Tea and milk — robot · 10 s
- Toppings — by hand · 12 s
- Shake and seal — robot · 8 s
- Hand-over — by hand · 8 s

PICK-UP

minute **20** served **52** walked away **0** hand-overs **72**

20 runs: away **1.2%** wait **2:38** **S$402**/day

B **Machines make the drink** 2 people, fixed posts

ORDERS IN · 0 cups in store

- Order and tag — by hand · 5 s
- Cup and ice — robot · 8 s
- Tea and milk — robot · 10 s
- Toppings — robot · 15 s
- Shake and seal — robot · 8 s
- Hand-over — by hand · 8 s

PICK-UP

minute **20** served **57** walked away **0**

20 runs: away **0.0%** wait **1:06** **S$465**/day

Navy = robot, white = by hand (click to switch) · red circle = a person · faded = walking · red cup = waiting for a person.

ALL FOUR SPLITS, MEAN OF 20 RUNS

EVENT DAY	PEOPLE	WALKED AWAY	WAIT	COST/DAY
Today's counter ✓	**2**	**1.2%**	**2:38**	**S$402**
Machines make the drink	2 fixed	0.0%	1:06	S$465
All by hand	4	0.0%	1:25	S$422
All robots	–	0.0%	0:58	S$562

✓ cheapest within the limit · fastest: All robots

Each split gets the fewest people, from the forecast roster up, and the better sharing rule that keep walk-aways within 2%. Cost per day: people hours at the wage plus robots at their monthly cost.

TAKEAWAY | On an event day, Today's counter is the cheapest split within the walk-away limit, at about S$402 a day. Machines make the drink needs 2 people at fixed posts and costs about S$64 more, for a median wait of 1:06.

SPEAKER NOTES · SPLIT THE COUNTER

This is the GM's decision: which steps of the counter stay human and which go to robots. Our research says Chagee is heading towards machines making the drink while people tag the order and hand it over; that is side B.

Click any station to switch it. Each side gets its forecast roster; change people with plus and minus. The table on the right is the simulation run for all four splits.

What it shows, honestly: on a normal day, all by hand is cheapest; robots buy a shorter wait, not a lower cost, at about 556 cups a day. On an event day, today's split is cheapest within the limit. Machines making the drink needs a second person at the peak, because one person cannot tag and hand over at opposite ends of the counter. About one and a half minutes.

Choose the split, roster to the forecast, and share the work to suit the split

Three moves for the GM, each with a trigger, then a pilot to test them.

WHAT THE FORECAST CHANGES, PEAK HOUR, TODAY'S COUNTER

DAY	FORECAST PEAK, CUPS PER HOUR	PEOPLE AT THE PEAK	WALK-AWAYS, FORECAST ROSTER AND BRIGADE	WALK-AWAYS, NORMAL-DAY ROSTER
Normal day	61	**1**	0.9%	0.9%
Busy day	92	**2**	0.0%	**20.8%**
Event day	153	**2**	1.2%	**53.8%**

1 Choose the split

Robots where speed matters more than cost; people where the work varies: tagging and hand-over.

2 Roster to the forecast

On today's counter, one more person for about every 83 forecast cups in the peak hour.

3 Share to suit the split

A brigade when hand steps sit along the line; fixed posts when machines make the drink.

- **Next step: pilot in 3 outlets**

  Shadow forecast only | **Roster** staff to it | **Roll out** if KPIs hold

  KPIs: cups per labour hour, wait time, walk-aways at the peak. Compare forecast and actual cups weekly.

- **Limits we know**

  All figures are illustrative assumptions, not Chagee data. Robot speeds and costs are assumed; breakdowns and breaks are not modelled.

- **To confirm with Chagee**

  How rosters are set today, robot costs per station, and whether outlets log wait times and walk-aways.

TAKEAWAY | Predictive AI sets how many people; the split sets what robots do; the sharing rule sets who does what. Next, test it in 3 outlets.

SPEAKER NOTES · THE GM'S PLAYBOOK

Three moves for the GM: choose the split, roster to the forecast, and share the work to suit the split. Then a pilot in 3 outlets: shadow, roster, roll out, judged on cups per labour hour, wait time and walk-aways.

Close on the limits: these are our assumptions, not Chagee data. New-store openings, the next part of our work, will use the same simulator before a store opens. About one minute, then questions.

THANK YOU

QUESTIONS AND DISCUSSION

OPIM639 · GROUP 3 · KEZIAH, JIN, AYUMI, REVAN

SPEAKER NOTES · THANK YOU

Likely questions: is the brigade always better? No; with spare staff fixed stations are as good. Is the forecast real? No, it is an illustration of the chain, built on stated assumptions.

Where every number comes from

FACTS QUOTED

Outlets in Singapore: 44. Store count used on the storyboard deck. The doc also cites 46 (VnExpress, earlier); the later directory count is used. *[L-sg-directory]*

Franchise share of FY2025 net revenue: 0.88. Secondary source; flagged wherever shown. *[L-koalagains]*

Company-owned share of FY2025 net revenue: 0.12. Secondary source; flagged wherever shown. Singapore sits in this group (I-sg-owned). *[L-koalagains]*

SOURCES

L-sg-directory Chagee Singapore store directory, mapped by the team (44 locations, checked 15 Oct 2026); Mothership, Sep 2026, https://mothership.sg/2026/09/chagee-more-heartland-stores-singapore-eugene-lee/ gives the same count. Taken from the team's ideation doc (OPIM 639_ Ideation Process), not re-checked for this deck.

L-koalagains KoalaGains, 'CHA business and moat', https://koalagains.com/stocks/NASDAQ/CHA/business-and-moat (SECONDARY - flag when used): FY2025 net revenue about 88% from the franchise (master franchise) model and about 12% from company-owned stores, the latter growing fastest. Taken from the team's ideation doc (OPIM 639_ Ideation Process), not re-checked for this deck.

L-yfchuhai YF Chuhai, https://www.yfchuhai.com/article/9751.html: Chagee's leaf supply chain is in China; it sources only two ingredients locally, fresh milk and fruit. Taken from the team's ideation doc (OPIM 639_ Ideation Process), not re-checked for this deck.

L-sec20f Chagee Holdings Form 20-F for FY2025, SEC EDGAR, https://www.sec.gov/Archives/edgar/data/2013649/000110465926050766/cha-20251231x20f.htm: separate centralized and regional warehouses to lower storage and logistics costs. Taken from the team's ideation doc (OPIM 639_ Ideation Process), not re-checked for this deck.

L-unsw UNSW BusinessThink, Oct 2024: Chagee semi-automation, baristas scan a QR code and the machine dispenses the formulation. (brief.md section 9)

I-sg-owned INFORMAL - team check recorded as a comment in the ideation doc: Singapore is company-owned and run by Chagee corporate, usual for new-entry and smaller markets. The underlying source is not named; confirm before presenting.

I-sg-groundfloor INFORMAL - quote in the team's ideation doc (Chagee Singapore's Lee: 'Whenever you see a Chagee, it's always on the first floor'; kiosk-style outlets in basements and MRT stations at entry in 2019). The article is not named in the doc; confirm the source before quoting.

I-team-automation INFORMAL - team research (Oct 2026): Chagee's counters are heading towards machines making the drink while people tag the order and hand it over; consistent with I-leeyen's 'push towards app-to-machine automation, sub-one-minute fulfilment'. Source to be added before it is cited on a slide.

I-team-app-first INFORMAL - team observation in the ideation doc: Chagee Singapore sells mainly through its app, with minimal order kiosks in outlets. Confirm before citing.

ASSUMPTIONS (ASSUMPTIONS.JSON, ILLUSTRATIVE)

Cups per outlet per year: 200000 cups/store/year

Share of the day's cups in each open hour: 0.04, 0.06, 0.1, 0.11, 0.08, 0.08, 0.09, 0.1, 0.1, 0.09, 0.08, 0.07 share of daily cups per open hour (10:00 to 22:00), sums to 1

Busy and event day multipliers: none 1, moderate 1.5, large 2.5 x forecast arrival rate

Busiest hours the multiplier lands on: 2 busiest forecast hours that get the surge

Seconds per cup by hand, per station: ticket 5, cup ice 10, tea milk 15, topping finish 12, shake seal 10, handover 8 seconds of one average worker per cup

Seconds per cup by robot, per station: ticket 2, cup ice 8, tea milk 10, topping finish 15, shake seal 8, handover 6 seconds per cup per machine unit

Stations the robots do today: ticket, tea milk, shake seal

Spread of worker speeds: 0.2 +/- share around average speed

Minute-to-minute variation in pace: 0.25 coefficient of variation, minute to minute

Share of new staff: 0.25 share of roster in first months

New staff speed: 0.7 x average speed

Coordination loss, people around robots: 0.9 multiplier on human-pool throughput in the mixed setup

Minimum people on the counter: all human 2, mixed 1, all machine 0 workers per open hour

Roster safety margin over the forecast: 1.2 x forecast peak rate

Labour cost per hour worked (SGD): 15.06 SGD per hour worked, fully loaded (statutory costs)

Robot cost per station unit per month (SGD): 1908.75 SGD per station machine unit per month

Attendant hours, all-robot counter: 1 workers per open hour

Walk-away limit for the GM's split table: 0.02 share of peak-hour orders that walk away

Synthetic app-intent dots (slide 05): 3000 synthetic app-intent dots on the map

Walking distance to collect: 1.2 km a customer will walk to collect

Distance decay, share of the walking distance: 1 distance decay length as a share of walk_km

Pull of not buying: 0.3 pull of not buying, against a store next door (= 1)

SPEAKER NOTES · SOURCES AND ASSUMPTIONS

Soft copy only.
